## How to create a .json file on a Windows computer

In the course, I am working on a Mac. In case you use a Windows machine, just follow this guide to create a .json file on your computer. As soon as you created the .json file, every step is equal to the ones presented in the videos.
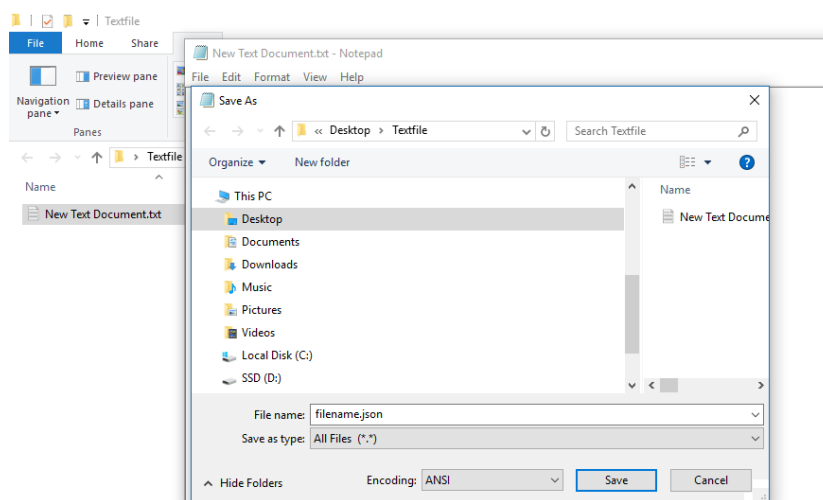

Required steps

Go to the folder where you want to save your manifest file to, right click and select "Text Document":

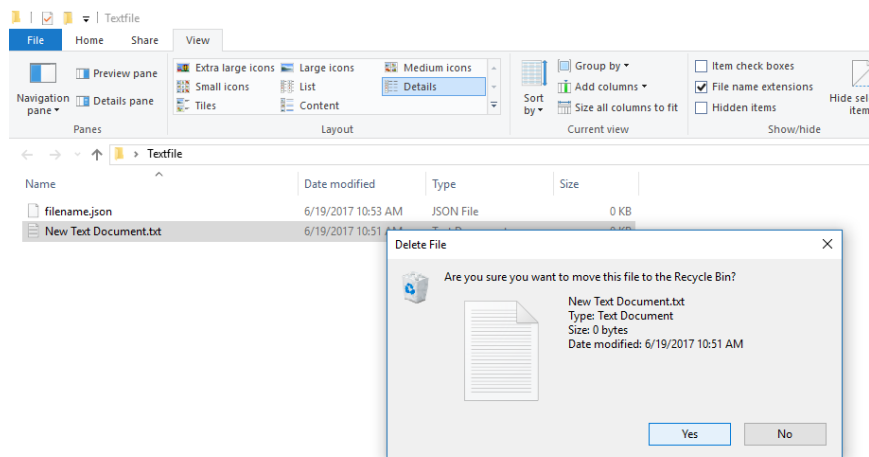

Open the document you just created, go to "File" and press "Save as":

Rename the file as you prefer, but make sure that the ending of the file name is .json and that "Save as type" is set to "All Files":

Press save, and delete the .txt file created in the first step:

Open the .json file that we just created. Now you should have an empty .json file as presented in the attached screenshot. Now you can simply continue as presented in the video. The only difference is, that in the video we first create the code and then save the file as .json, right here we already created the .json file, so we only need to press save as soon as our code is finished:
